**DETAILED ACTION**

***Claim Rejections - 35 USC § 112***

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claim 4 recites the limitation "the resistor ..." in line 1. There is insufficient antecedent basis for this limitation in the claim.

***Claim Rejections - 35 USC § 102***

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1, 6, 10 are rejected under 35 U.S.C. 102(b) as being anticipated by Kujawa et al, US. Pat. No. 5,729,167.

5. Claims 1, 10, Kujawa teaches a circuit arrangement for detecting the state of at least one electrical switch [*title, abstract*] comprising:

a) in each case a set input and a sensor output, each of which is assigned to a respective electrical switch [*135 of fig. 1*],

b) wherein the respective switch can connect the sensor output to a first potential via a first current path when a signal with the value logic "1" is present at the set input and can connect the sensor output via a second current path to a second potential when a signal with the value logic "0" is present at the set input [col. 2, lines 34-57], and

c) wherein a wake-up signal is generated at a wake-up signal output if a current which is greater than a predetermined threshold current is detected in the first or second current path [123 of Fig. 1, see related disclosure].

6. Claim 6, Kujawa teaches a digital control output of the microcontroller [118 of Fig. 1] is connected in each case to a set input of the state-detection circuit arrangement [col. 3, lines 11-26], wherein the wake-up signal output of the circuit arrangement is connected to the wake-up signal input of the microcontroller [148 of Fig. 1], and wherein the microcontroller determines the switch setting or the change to the switch setting of the at least one switch from the states of the digital control outputs and the state of the wake-up signal, and if necessary triggers dependent actions as required as a function of the switch setting or the change to the switch setting [col. 3, lines 12-53].

#### ***Allowable Subject Matter***

7. Claims 2-3, 5, 7-9, 11-15 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
